

A. J. ...

1. The first step is to identify the key components of the system. This includes understanding the hardware, software, and data involved. The next step is to define the requirements for the system, including performance, security, and scalability. Once the requirements are defined, the next step is to design the system architecture. This involves creating a high-level overview of the system and then breaking it down into smaller, more detailed components. The final step is to implement the system, which involves writing the code, configuring the hardware, and testing the system to ensure it meets the requirements.

11. 11. 1952

1. The first step is to identify the problem or question that needs to be answered. This involves understanding the context and the specific requirements of the task.
