11. *Chlorophyll a* and *Chlorophyll b* were determined in the whole cells of *C. reinhardtii* by the method of Lichtenthal and Whistler (1973). The cell suspension (100 μ l) was extracted with 1 ml of 80% methanol. The extract was centrifuged at 10,000 $\times$ g for 5 min. The supernatant was transferred to a vial and the residue was extracted with 0.5 ml of 80% methanol. The two extracts were combined and the solvent was evaporated under reduced pressure. The residue was dissolved in 1 ml of 80% methanol. The absorbance of the solution was measured at 663 nm and 646 nm. The concentrations of *Chlorophyll a* and *Chlorophyll b* were calculated using the following equations: $Chl\ a\ (\mu g\ ml^{-1}) = 12.7 \times A_{663} - 8.2 \times A_{646}$ and $Chl\ b\ (\mu g\ ml^{-1}) = 21.6 \times A_{663} - 51.0 \times A_{646}$.
