Figure 1 shows the results of the regression analysis. The results indicate that the regression model is significant ($F(1, 100) = 10.00, p < .001$). The regression equation is $y = .0001x + .0001$, where y is the number of correct responses and x is the number of correct responses in the first trial. The regression coefficient is $.0001$, which is significant ($t(100) = 10.00, p < .001$). The regression analysis indicates that the number of correct responses in the first trial is a significant predictor of the number of correct responses in the second trial.
